

### OTHER GOLF TROLLEY BATTERY COMPATIBILITY

If you already have a golf trolley battery, don't throw it away – you may be able to use it with a GoKart.

To work out if your battery is OK, check the printing on the side to find the capacity in Amp/hours (Ah), also you'll need to measure its size. The battery must be rated between 20 and 22Ah, with a case size of 18 x 7.5 x 16.7 cms (LxWxH). The exact Ah isn't important as long as it's between these ranges, but the battery size has to be within a millimetre or two of the dimensions above.

If you have one of these, we can supply the cover and wiring that allows it to lock into the GoKart's frame and connect to the trolley's electrical system. We sell this in a kit form, including instructions. It's very easy to fit and once done, it stays on and makes the battery just the same as the ones we supply.

**SEE PRODUCT IN STORE [HERE](#)**

There is one final point to check before ordering; some makes of battery have the correct case size but the positive and negative terminals prevent it fitting into the GoKart. These terminals, or the bolts that screw into them, mustn't protrude above the top of the case. Check the pictures on the next page, these illustrate the differences.

Most batteries are OK, but occasionally we come across one that won't work. If you have a battery where the terminals protrude, we can modify the battery casing to make it fit, but your battery will have to be sent to us.
